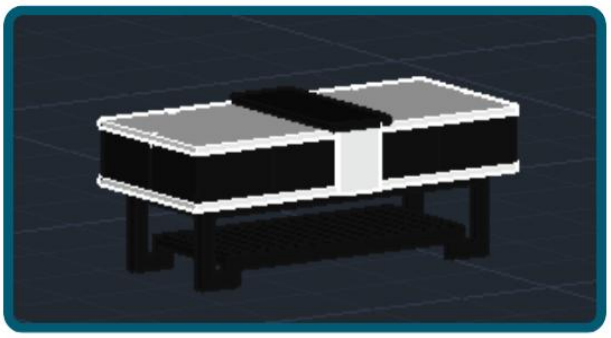
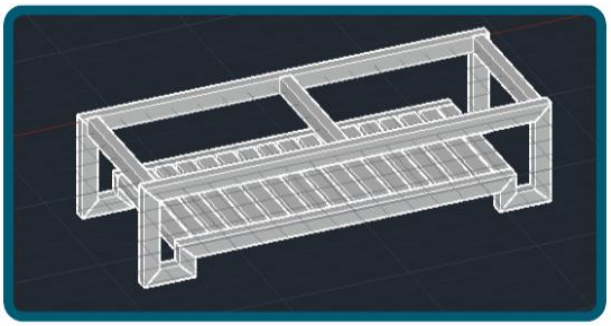
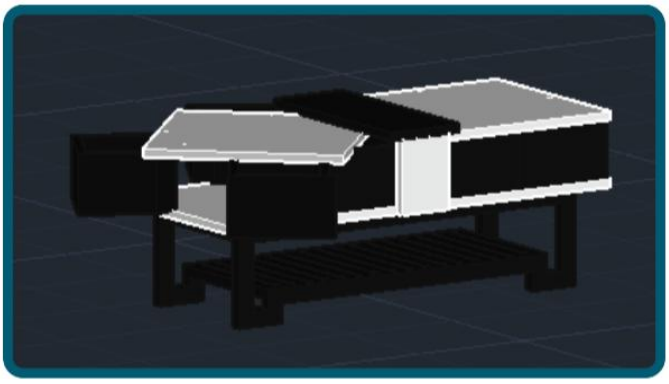
INTRODUCTION

Thinking about product development is not easy. You need to consider many things like design, size, and materials to be used. So we thought of innovating a center table because most center tables have similar designs and functions.







AUTOCAD 3D SKETCH

First, we sketched in Autocad to visualize the design we wanted and these were the results.

CUTTING PLYWOOD

Because we don't have a power tools, we asked help from someone who have a power tools and we decided to cut it.

SMOOTHING EDGES

We are currently sanding the plywood's sides to smooth out any rough areas and create even, smooth edges.

PROGRESS OF DRAWER

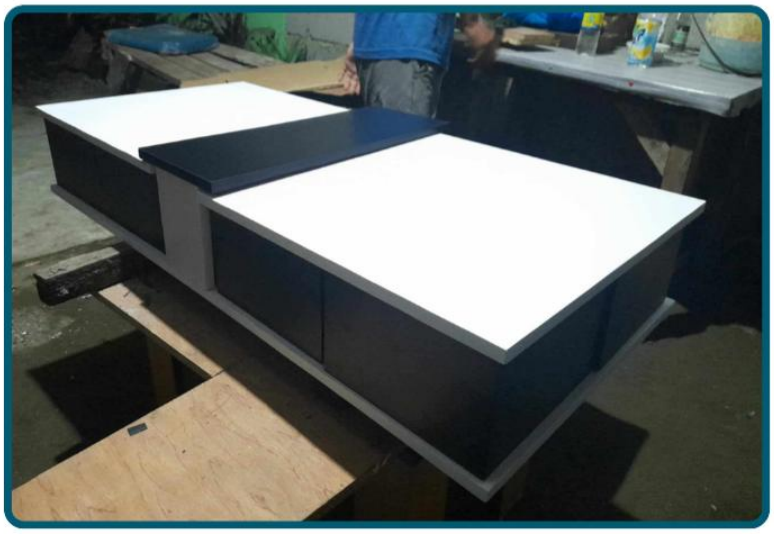
This is for the part of the drawer. After we set up the drawer, we decided to ask for help again from someone who has power tools to router the side part of drawer.

FOR THE CENTER

We had a piece made for the center of the drawer using solid wood, to make the drawer function properly, we will place a bearing for it to rotate smoothly.

ASSEMBLING

We installed drawers and incorporated bearings to facilitate smooth rotation. During testing, some drawers didn't rotate seamlessly, prompting removal and reinstallation until optimal performance was achieved.



APPLYING FORMICA

Once perfected, we applied Formica for an aesthetically pleasing finish.

MAKING STAND

We used a 1x2x10 ft piece of wood to build the stand.

FINISHING

To make the sections with holes and nail marks smoother and more even, we'll apply wood putty to the stand. After applying , we asked the IV-BIT-AUTOMOTIVE students if we could borrow their spray paint for our stand to make the color shiny and look cleaner.

The path to this moment has been long and arduous, filled with challenges that tested our limits. There were countless late nights fueled by caffeine and determination, periods of doubt, and moments of sheer exhaustion. But through it all, the unwavering dedication to our goal pushed us forward.

THANK YOU!
